

Copy-Ready Application Texts

First-person application blocks for Foresight.

Generated 2026-06-17

Short profile

I am an independent AI systems builder focused on the infrastructure around agents: multi-model routing, local memory, tool-use boundaries, voice interfaces, remote command loops, and evaluator-style quality gates.

My strongest fit for Foresight is Secure AI from the builder side. I have spent the last year building and stress-testing personal multiagent systems where reliability, authority boundaries, model choice, memory governance, and remote execution become concrete engineering problems.

Project direction

I would like to develop practical methods for making multiagent systems more reliable through scoped tool access, model routing, evaluator loops, memory provenance, and transparent audit surfaces.

As an applied extension, I am exploring ECSA, a predictive AMR AI architecture that models antimicrobial resistance as a probabilistic graph/state-space system with uncertainty, stability, lab-in-the-loop validation, and governance.
